This process is exactly the reverse of the process of adding together a given number of definite sine-curves to form a resultant periodic curve. The latter process is . synthesis, and is a much simpler operation than that of analyzing a given curve to evaluate its proper sine-components. Many important facts may however be ascertained by the graphical process of constructing alternating-curves from given sine-curves; either by adding sine-curves together or by multiplying them by each other. While any periodic irregular shaped wave may be made up of the sum of sine-waves having frequencies that are both an even and an odd number of times the frequency of the fundamental or resultant curve, in ordinary alternating-current practice the irregular periodic pressure and current curves are composed only of the odd sine-components; or as sometimes stated only of the odd...
