Not illustrated. 1878 Excerpt: .as the tensions differ more or less from such as are represented in figure 15, the line where the surfaces A-B, B-C, C-A meet will be in stable equilibrium with respect to the formation of such a mass as we have considered, since W_s -- W_v will be positive. The same will be true for less values of $/D$. For greater values of o , the value of TPS -- W_v , which measures the stability with respect to the kind of change considered, diminishes. It does not vanish, according to our equations, for finite values of Jud . But these equations are not to be trusted beyond the limit at which the mass D ceases to be of sensible magnitude. But when the tensions are such as we now suppose, we must also consider the possible formation of a mass D within a closed figure in which the surfaces D -A, D -B, D -C meet...
